PARTS LIST/RECOMMENDED SPARE PARTS LIST ....................... 15
The VRC Positioner is a force balance device. There are two (2) forces that oppose each other within the Positioner.

Reference figure 1.

Force 1 is created by the signal pressure (3-15PSI) being applied to the flexible SIGNAL DIAPHRAGM. Force increases as pressure is increased.

Force 2 is created by the rotation and cam rise of the FEEDBACK CAM. Force is increased as the CAM rotates from 0 to 90 degrees.

The two (2) opposing forces meet at the BALANCE BEAM which has the SPOOL VALVE attached at one end.

When the two (2) forces are not balanced, for example: an increase in signal pressure from 3 PSI to 8 PSI, the BALANCE BEAM is deflected causing the SPOOL VALVE to flow air to the actuator and rotation of the FEEDBACK CAM occurs until Force 2 equals Force 1. When this happens, the BALANCE BEAM and SPOOL VALVE return to a null position (SPOOL VALVE off) and actuator rotation stops.
**MODULE FUNCTION**

The VK02 I/P Module uses the latest in miniaturized electronics and pressure sensor technology to convert a 4–20 milliamp electrical input signal into a 3–15 PSI pressure output signal.

The VK02 I/P Module is used in the Model VE Positioner and can be installed into a Model VP Positioner to change it from a VP to a VE model. The VK02 I/P Module is designed for all general purpose location applications.

**OPERATION**

Supply air is ported to the I/P MODULE through an internal Positioner passage. It is then filtered and regulated down to 25 PSI.

The regulated air is ported internally in the Module to a COIL/NOZZLE and allowed to bleed off in a controlled manner to develop the 3–15 PSI signal pressure.

A flexible teflon coated steel DIAPHRAGM is positioned over the nozzle and is magnetically moved closer or farther away from the nozzle to increase or decrease the 3–15 PSI signal pressure.

Control for the 3–15 PSI signal pressure is achieved by electronically comparing the 4–20 milliamp input signal with the 3–15 PSI pressure sensor signal.

When a change occurs on the the 4–20 mA input signal, the electronics cause a change in current flow to the COIL/NOZZLE ASSEMBLY and thus a change in the magnetic field strength. This then causes the DIAPHRAGM to change position and signal pressure is charged to correspond to the new 4–20 mA input signal.

**HAZARDOUS LOCATIONS APPROVALS**

The integral I/P converter for the Model VI Positioner has the following Hazardous Location Approvals:

I/P Converter P/N. VK12, Types 22/05–65

Factory Mutual approved for:

- Intrinsically Safe:
  - Class I, Division 1 Groups A,B,C,D
  - Non-incendive / Division 2:
    - Class I, Division 2 Groups A,B,C,D

- CSA approved for:
  - Intrinsically Safe:
    - Class I, Division 1 & 2, Groups A,B,C,D

For applications in Hazardous Locations reference control documents No. 900842/900843, available by calling VRC at 513-677-8724 / fax 513-677-8751.

POSITIONER INSTALLATION PROCEDURE

INTRODUCTION
The Positioner controls the position of a rotary or linear pneumatic actuator and its final control element by modulating the flow of supply air to the actuator in response to a control signal. There are (3) base models available:
- Model VP = pneumatic positioner
- Model VE = electro-pneumatic positioner
- Model VI = electro-pneumatic (for general purpose HazLoc Locations)

MOUNTING PROCEDURE
The Positioner can be installed on Single or Double Acting rotary or linear actuators. The procedure is typical and assumes that the optional Universal Mounting Kit is used to mount the positioner to a rotary actuator.
1. Move the actuator to its start position.
2. Secure the Universal Bracket to the actuator.
3. Mount the Adapter to the actuator shaft.
WARNING: The Adapter must be bolted to the actuator shaft to assure a rigid connection between the Positioner and actuator.
CAUTION: The Adapter (coupler) also may need to be machined to the proper length so that the Positioner bottoms out on the Bracket before the Adapter bottoms out inside the Positioner female shaft.
4. Align the female shaft of the Positioner with the Adapter and slide the Positioner down the actuator shaft until the Positioner is flush with the Bracket.
CAUTION: An interference fit between the Adapter and Positioner shaft greater than 0.001 inch significantly increases the Positioner shaft torque and can damage the Positioner.
5. Cycle the Positioner and then place it in a mid-travel position. Use the Positioner mounting bolts to secure the unit to the Bracket.

PNEUMATIC CONNECTIONS
All air ports require user supplied NPT fittings. Unused ports require NPT pipe plugs. Scale free piping should be blown out before installation to prevent dirt and debris from entering the Positioner. Use accepted practice when installing the piping. Install strainer valves, drains, and seals as required. The piping should slope upward toward the unit to reduce condensation from entering the Positioner. Use flexible connections for supply air and signal air connections.
Use pipe sealant on all air fittings. Teflon sealant is recommended. Do not use tape.
CAUTION: Maximum torque for the 1/4 and 1/8 NPT ports is 12 and 6 ft. lbs., respectively.

1. Connect outlet ports P1 and P2 to the actuator using 1/4 inch NPT fittings. P1 and P2 are related to gauge ports G1 and G2 respectively.
2. P2 is always connected to the actuator port used to move the actuator away from its start position.
P1 is connected to the remaining actuator port for Double Acting actuators and Single Acting actuators with air assist. Otherwise P1 is plugged.
3. Connect supply air to the Positioner SUPPLY port using a 1/4 NPT fitting.
4. Model VE & VI Positioners require the SIGNAL port to be plugged and are shipped from the factory with the plug installed. On Model VP Positioners connect the signal pressure to the SIGNAL port using a 1/8 NPT fitting.

NOTE: See I/P section for wiring instructions.

SUPPLY A IR REQUIREMENTS
Supply air is required to be clean, dry, and free from instrument quality air as defined in the ISA-S7.3 specification. Regulated air is not required, but a supply air filter should be installed.
WARNING: Maximum pressure to be applied to the Positioner is 150 PSIG.

FEEDBACK CAM
With the Positioner mounted and the actuator at its start position the CAM FOLLOWER and bearing should be at the 0 degree point on the FEEDBACK CAM. Direct or Reverse Acting is accomplished by selecting the D or R side of the FEEDBACK CAM.

POSITIONER VENT
The Positioner exhausting air through a one way check valve that is integral to the Positioner housing. In applications such as natural gas where the supply gas medium is to be recovered, the vent can be blocked using a cap plug. (VRC part number V00026).
WARNING!
IF THE CAP PLUG IS INSTALLED IN THE POSITIONER BREATHING VENT THE POSITIONER MUST BE EXHAUSTED THROUGH THE 1/2 NPT CONDUIT. FAILURE TO DO SO CAN RESULT IN BODILY INJURY DUE TO A BUILD UP OF INTERNAL PRESSURE, AND SUBSEQUENT RUPTURE OF THE POSITIONER HOUSING AND COVER.

SPECIAL INSTRUCTIONS FOR MODEL VI POSITIONER
The Model VI Positioner is designed for both General Purpose and Hazardous Locations as defined by the National Electrical Code (NEC). The Model VI has an integral I/P converter E.N. VIK12 (type 22/06-55) that is FM & CSA approved as Intrinsically Safe and Non-Explosive for use in Hazardous Locations.
For applications in Hazardous Locations reference control Documents No. 900847/900848, available by calling VRC at 513-877-8724 or fax 513-877-8731.
CALIBRATION PROCEDURE

PNEUMATIC SECTION

NOTE: The VRC Positioner is calibrated at the factory for 0-90 degree rotation. Small adjustments may be needed due to mounting or differences in actuator rotation.

PRIOR TO CALIBRATING:

NOTE: REF. PAGE 6A FOR DRAWINGS

1. Tools required:
   - Regular screwdriver (for removing HSG cover)
   - For VE models: 4-20mA calibrator
   - For VP models: 3-15 psi signal source

2. This procedure assumes the positioner is correctly mounted to an actuator and supply pressure is on.

3. For VE models, verify the I/P module is calibrated by referring to page 7 of these instructions.

4. For CLOCKWISE and COUNTERCLOCKWISE orientation, the front of the positioner is where the supply air port is located. Ref. figure 3.

5. DIRECT and REVERSE ACTING. Determine which positioner response you require:
   - DIRECT ACTING—is when the actuator is required to rotate Clockwise with increasing control signal.
   - REVERSE ACTING—is when the actuator is required to rotate Counter clockwise with increasing control signal.

After determining your requirement, verify the positioner feedback cam is installed correctly for your application. A "D" is molded on one side of the cam and on the opposite side an "R" is molded.

For DIRECT ACTING, the "D" side should be facing up.
For REVERSE ACTING, the "R" side should be facing up.

CALIBRATION PROCEDURE

ZERO ADJUSTMENT

NOTE: ZERO is defined as the START point of actuator rotation.

1. With 3 psi signal pressure applied, verify the actuator is at its start point by manually deflecting the Balance Beam toward the front of the positioner housing while observing the Feedback Cam and Bearing Holder arrow (ref. figure 33). The arrow should be pointed at the "0" on the Feedback Cam. If not, turn off supply air and reposition the Cam by removing the Wing Nut and unclamping the Cam. Reposition the Cam as required. Reinstall Wing Nut and turn supply air on.

2. Apply 3 psi signal pressure.

3. Rotate the ZERO Thumbwheel as required
   - Clockwise rotation moves the Zero point upscale on the Cam (toward 90 degrees)
   - Counterclockwise rotation moves the Zero point down scale on the Cam (toward 0 degrees)

NOTE: The Zero Thumbwheel is designed to give a feel for the amount of adjustment being made. Each click of the Thumbwheel is a .5 degree adjustment change.

CAUTION: Do not force the rotation of the Zero Thumbwheel, the Thumbwheel will rotate freely throughout its adjustment range and forcing the rotation could damage the adjuster.

4. Zero is adjusted properly when increasing signal pressure from 3 psi to 3.5 psi causes the actuator to rotate away from its start position (away from 0). Repeat step 3 if required.

SPAN ADJUSTMENT

NOTE: SPAN is defined as the full travel position of the actuator.

1. Apply 15 psi signal pressure to the positioner.

2. Determine if more or less actuator rotation is required.

NOTE: A quick check to verify if the actuator is against the actuator stops is to manually deflect the Balance Beam away from the front of the positioner. If the actuator continues to rotate when the Balance Beam is deflected, an increase in Span adjustment is required.

3. Rotate the SPAN Adjuster as required.
   - Clockwise rotation of the adjuster decreases SPAN.
   - Counterclockwise rotation of the adjuster increases SPAN.

NOTE: The Span Adjuster is designed to give a feel for the amount of adjustment being made. Each click of the adjuster is approximately 1 degree of change at the 90 degree setting.

4. SPAN is adjusted properly when decreasing signal pressure from 15 psi to 14.5 psi causes the actuator to move away from the actuator stops (away from 90 deg.). Repeat step 3 if required.

5. Recheck Zero adjustment.
NOTE: Figure 3A shows the correct relationship for the Cam and Bearing Holder for a DIRECT ACTING application when the actuator is at its start point of rotation (3 psi applied).

**FIG. 3A**

CALIBRATION PROCEDURE (POSITIONER MODEL VE)

The VK02 I/P Module comes from the factory pretested and fully calibrated and should not need recalibration on new installations. If the unit appears to need calibration, check all pipe fittings and connections for air leaks prior to performing the calibration procedure.

**NOTE:** To calibrate the I/P MODULE, the following is required:

a. 0-30 PSI pressure gauge in ** SIGNAL PORT **

b. 4-20 mA calibrator (min. 12 volt output)

c. Small regular screwdriver

d. 3/16 Allen wrench

Reference figure 4.

**BIAS PRESSURE ADJUSTMENT**

This adjustment ensures a proper mechanical relationship between the **CONTROL NOZZLE** and the teflon coated **DIAPHRAGM**.

1. With supply pressure applied and NO electrical signal applied, check the signal pressure gauge. The gauge should read 2.5 to 3.0 PSI.

2. If required, using the 3/16 Allen wrench, adjust the **BIAS PRESSURE SCREW** to obtain 2.5 to 3.0 PSI. Clockwise decreases pressure, counterclockwise increases pressure. Typically only small adjustments will be required.

**NOTE:** If the pressure does not adjust or there is no pressure showing on the **SIGNAL PRESSURE GAUGE** there may be an air leak. Check to ensure the SIGNAL PORT has been plugged and all O-rings are installed. Also check for any leakage at the gauge.

CONTINUING TO ADJUST THE BIAS PRESSURE SCREW UNDER THESE CONDITIONS CAN DAMAGE THE MODULE.

**ZERO/SPAN ADJUSTMENT**

1. With supply pressure still on, apply 4 millamps to the I/P MODULE. Adjust the **ZERO POT** for 0 PSI.

2. Apply 20 millamps, adjust the **SPAN POT** for 15 PSI.

3. ZERO and SPAN interact, repeat steps 1 and 2 and readjust as required.
MODULE FUNCTION
The VK02 I/P MODULE converts a Model VP (pneumatic positioner) into a Model VE (electro-pneumatic) positioner. The Model VE Positioner is designed for use in General Purpose Locations, and is not approved for use in Hazardous Locations as classified by the NEC.

WIRING MUST COMPLY WITH LOCAL CODES AND THE NATIONAL ELECTRICAL CODE (NEC)

INSTALLATION PROCEDURE
1. Reference figure 5.
2. Turn off supply air to the Positioner and remove cover.
3. Remove (2) 1/16 NPT pipe plugs located near the SPOOL VALVE.
4. Install (2) o-rings into o-ring glands (where pipe plugs were removed) provided in kit.
5. Install I/P MODULE using (2) captive screws provided.
6. Ensure SIGNAL PORT is plugged and sealed using 1/8 NPT pipe plug provided in kit.
7. Terminate field wiring as shown below. No polarity need be observed. The connector is depluggable for wiring ease.
8. Turn on supply air and check calibration.

SPEED CONTROL JUMPERS
1. The speed control jumpers show the response of the Positioner to an input signal change.
2. Prior to changing the jumper selection, ensure the signal input to the Positioner is set to 4 milliamps or less. Changing the speed control jumper with more than 4 milliamps applied will cause an immediate change in valve position.

SPOOL VALVE
**VK12 I/P MODULE INSTALLATION**  
**TYPE 22/06-65**

**MODULE FUNCTION**

The VK12 I/P Module changes a Model VP or VE positioner into a Model VI positioner. The Model VI positioner is designed for use in General purpose and Hazardous Locations as defined by the NEC.

**WIRING MUST COMPLY WITH LOCAL CODES AND THE NATIONAL ELECTRICAL CODE (NEC)**

**WARNING:**

*FOR HAZARDOUS LOCATIONS APPLICATIONS*  
REFERENCE CONTROL DOCUMENTS NO. 900842/900845  
AVAILABLE BY CALLING VRC AT 513-677-8724/FAX 677-8731

**INSTALLATION PROCEDURE**

**TOOLS REQUIRED:** Regular slotted screwdriver, 3/16 hex key, 5/32 hex key (Allen wrenches)

*Changing a Model VP into a VI Positioner*
1. Reference figure below.
2. Turn off supply air to the Positioner and remove cover.
3. Remove (2) 1/16 NPT pipe plugs located near the SPOOL VALVE.

4. Install (2) o-rings into o-ring glands (where pipe plugs were removed) provided in Kit.
5. Install the VK12 I/P Module using the (2) captive screws.
6. Insure SIGNAL PORT is plugged and sealed using 1/8 NPT pipe plug provided in Kit.
7. Terminate field wiring.
8. Turn on supply air and check calibration.

*Changing a Model VE into a VI Positioner*
1. Reference figure below.
2. Turn off supply air to the Positioner and remove cover.
3. Remove the VE I/P Module by unscrewing the (2) captive screws.
4. Install the VK12 I/P Module.
5. Insure SIGNAL PORT is plugged and sealed using 1/8 NPT pipe plug provided in Kit.
6. Terminate field wiring.
7. Turn on supply air and check calibration.
LIMIT SWITCH MODULE
INSTALLATION

MODULE FUNCTION
The LIMIT SWITCH MODULE provides mechanical or proximity switch contacts for sensing Positioner shaft position, typically 0 and 90 degrees. There are (2) modules available:
- S1 = mechanical switches 2 SPST
- S2 = proximity switches 2 SPST

The Positioner can be ordered with the SWITCH MODULE and CAMS installed at the factory or S1 and S2 SWITCH MODULE kits are available for easy field installation.

INSTALLATION PROCEDURE
1. Turn off all power and supply air to the Positioner.
2. Reference Figure 6.
3. Remove the WING NUT and FEEDBACK CAM.
4. Slide one of the SENSOR CAMS (spike side down) onto the MAIN SHAFT.
5. Slide the SPRING and second SENSOR CAM (spike side up) onto the MAIN SHAFT.
6. Thread the LOCK NUT onto the MAIN SHAFT (spike side down). Tighten securely.
7. Reinstall the FEEDBACK CAM and WING NUT.
8. Install the SWITCH MODULE.

NOTE: Ensure the switch plungers (S1 only) clear the SENSOR CAMS prior to tightening the fasteners. DO NOT OVERTIGHTEN.

WIRING MUST COMPLY WITH LOCAL CODES AND THE NATIONAL ELECTRICAL CODE.

1. Attach the field wiring to the LIMIT SWITCH MODULE using the labels provided on the terminal block as a guide. 4\xA0x SWITCH WIRING DIAGRAMS are included in these instructions.

FIG. 6

NOTE: Some internal Positioner parts not shown for clarity
LIMIT SWITCH MODULE
ADJUSTMENT PROCEDURE AND WIRING DIAGRAMS

ADJUSTMENT PROCEDURE

This procedure assumes the Positioner is mounted on an actuator and the FEEDBACK CAM is set at 0 degrees when 3 psi signal pressure is applied and rotates to 90 degrees when 15 psi signal is applied.

Each switch is independently adjusted by changing the appropriate SENSOR CAM position on the MAIN SHAFT.

MATERIAL REQUIRED: Ohmmeter or continuity tester.

1. Connect the ohmmeter to the LOWER switch terminals.
2. Turn on supply air and apply 3 psi signal air. (AUX for electro-pneumatic units)
3. Adjust the LOWER switch by lifting and rotating the LOWER SENSOR CAM until the switch indicates ON on the ohmmeter.
4. By increasing then decreasing signal air pressure ensure the switch turns OFF as the actuator moves away from 0 degrees, then turns back ON as the unit rotates back toward 0 degrees.
5. Repeat steps 2, 3 and 4 as needed.
6. Change the meter connections to the UPPER switch terminals.

NOTE: When S1 mechanical switches are being adjusted, connect the meter to the C (common) and N.O. (normally open) terminals.
7. Apply 15 psi signal air.
8. Adjust the UPPER switch by depressing and rotating the UPPER SENSOR CAM until the switch indicates ON on the ohmmeter.
9. By increasing then decreasing signal air pressure, ensure the switch turns OFF as the actuator moves away from 90 degrees, then turns back ON as the unit rotates back toward 90 degrees.
10. Repeat steps 7, 8 and 9 as needed.
11. As a final check, rotate the actuator through its range and verify the limit switches are set properly.

S1 LIMIT SWITCH MODULE WIRING DIAGRAM

S2 LIMIT SWITCH MODULE WIRING DIAGRAM

POSITIONER WITH MODULE INSTALLED

MODEL VF700-S1
TI 4-20 MILLIAMPS TRANSMITTER MODULE
INSTALLATION AND CALIBRATION

MODULE FUNCTION

The TI TRANSMITTER MODULE is designed to give a 4–20 milliamperes linear output signal with a positioner shaft rotation. The unit is environmentally sealed and loop powered. The TI transmitter is designed for use in General Purpose Locations and is not approved for use in Hazardous Locations as classified by the NEC.

WIRING MUST COMPLY WITH LOCAL CODES AND THE NATIONAL ELECTRICAL CODE (NEC)

INSTALLATION PROCEDURE

1. Reference Figure 7.

2. Rotate the Positioner shaft to the 0 degree point.

NOTE: Installation into a VRC model VE Positioner (electro-pneumatic) requires the I/P module be removed and reinstalled after the transmitter has been reinstalled.

3. Install the TRANSMITTER MODULE into the Positioner with the MODULE GEAR ARROW pointed at the Positioner MAIN SHAFT.

4. Before completely tightening the (2) captive fasteners, push the MODULE toward the MAIN SHAFT to fully engage the two gears. A loose engagement of the two gears will cause poor MODULE performance. Tighten the fasteners when the gears are fully engaged. DO NOT OVERTIGHTEN.

5. The MODULE has a "plug-in" wiring terminal. Pull the terminal plug loose and terminate field wiring. NO POLARITY NEED BE OBSERVED. Reinstall the terminal plug. The LED will light when power is applied.

CALIBRATION

1. With the Positioner at the 0 degree point on the FEEDBACK CAM, adjust the MODULE "ZERO" pot for 4 millamps output.

2. Rotate the Positioner to the 90 degree point by applying 15 PSI signal pressure or 20 millamps signal to the I/P MODULE (VE model).

3. Adjust the TRANSMITTER MODULE for 20 millamps output by adjusting the SPAN pot.

4. Repeat steps 1 thru 3 as necessary due to interaction of ZERO and SPAN adjustments.

NOTE: The output from the TRANSMITTER MODULE is jumper selectable to give a 20 to 4 milliamp output signal with 0 to 90 degree rotation. Simply move the two (2) MODULE jumpers to the "R" position and recalibrate the ZERO pot.

NOTE: For reverse acting applications, refer to Fig. 7A for proper orientation of the Transmitter Module gear. The jumpers must be moved to the "R" selection also.
